Abstract of DE4117422

The monitoring appts. has a row of dampers arranged in the fluid stream and has an appts. reacting to the pressure differential between the inlet and outlet side of the filters to produce and display a signal from the quotients of both pressure differences. The dampers are placed in the fluid stream behind the filter (claimed). USE/ADVANTAGE - The appts. is used for monitoring the soiling degree of filter esp. for hydraulic fluid filters. The appts. gives high accuracy and repeatability of measurements.
